

Task Capacity Planning — BardBox Studio

Document purpose: Internal review — to be confirmed by department managers before development begins.

Date: June 2026

Status: Draft — Awaiting Approval

What Is Daily Capacity?

Daily capacity is the **maximum number of tasks one person can realistically complete in a single working day**, based on their role and the type of content they are working on.

This is different from the existing "Task Cap" (max open tasks at once). Daily capacity is about **how much one person can produce per day** — not how many tasks are assigned to them in total.

Example:

A designer can finish 5 static images in a day, but only 3 carousels — because a carousel has 8–10 slides and takes much longer.

The system uses this to automatically schedule tasks so no one is overloaded on any given day.

Why This Matters

Without daily capacity limits:

- A designer could get 8 carousels assigned on the same day and miss all of them
- The system has no way to know that a reel edit takes 3× longer than a story upload
- Managers have to manually redistribute work

With daily capacity:

- Tasks are auto-assigned to whoever has room on that day
- If everyone is full, the task moves to the next available day automatically
- Emergency tasks displace lower-priority tasks and reschedule them

Proposed Capacity Per Role

Please review and adjust numbers based on your team's actual output.

These are starting defaults — they can be changed per person in the admin panel.

Graphic Designer

Content Type	Tasks Per Day	Notes
Carousel	3	8–10 slides per carousel

Content Type	Tasks Per Day	Notes
Static / Image	5	Single frame, faster turnaround
Story Frame	6	Small canvas, minimal elements
Infographic	2	Data-heavy, complex layout
Thumbnail	7	Quick crop + text overlay
Flyer / Poster	3	Print-quality, more detail
Logo / Branding	1	Conceptual, revision-heavy
Reel Cover / Banner	6	One frame, brand consistent

Video Editor

Content Type	Tasks Per Day	Notes
Short Reel (up to 30 sec)	3	Trim, captions, music sync
Long Reel (30–60 sec)	2	More cuts, transitions
YouTube Video	1	Full edit, colour grading
Story Animation	4	Short looping clips
Highlight Reel	2	Multi-clip assembly
Lyrical / Lyrics Video	2	Sync-heavy work

SMO — Social Media Operator (Scheduler / Publisher)

Content Type	Tasks Per Day	Notes
Post Scheduling (any)	10	Pure publish action
Caption Writing + Scheduling	7	Writing adds time
Story Upload	12	Fastest workflow
Reel Upload + Description	6	Hashtag research + cover selection

Copywriter *(if role is added later)*

Content Type	Tasks Per Day	Notes
Social Media Caption	12	Short, quick creative bursts
Blog Post (500–1000 words)	2	Research + draft
Long-Form Article (2000w+)	1	Deep focus work
Ad Copy (multiple variations)	5	Versioning takes time

How the System Will Use These Numbers

When a task is created (from an uploaded monthly sheet or manually):

1. The system checks the content type of the task (e.g. "Carousel")
2. It looks up the daily capacity for that role + content type (e.g. Designer + Carousel = 3)
3. It counts how many tasks of any kind are already assigned to each designer on the deadline day
4. It assigns to the designer with the most room — if everyone is full on that day, it finds the next available day automatically
5. No manual redistribution needed

Emergency Task Behaviour

If a client calls in an emergency:

1. Manager marks a task as Emergency in the system
2. The system finds the lowest-priority task on the same day for the same person
3. That task is automatically pushed to the next available slot
4. The original deadline is saved for audit purposes
5. The affected employee is shown the updated schedule

What Needs Manager Confirmation

Please review and answer the following:

- ☐ Are the capacity numbers above accurate for your team?
- ☐ Should capacity differ per seniority level (e.g. junior designer = 2 carousels/day, senior = 4)?
- ☐ Do you want to set capacity globally by role, or per individual employee?
- ☐ Are there content types missing from the list above that your team works on?
- ☐ What is the standard working day for capacity purposes — 8 hours? 6 productive hours?
- ☐ Should weekends be excluded from scheduling, or handled case-by-case?

Implementation Plan (Once Approved)

Step	What Gets Built	Time Estimate
1	Database table for role × content type capacity	1 day
2	Admin panel to view and edit capacity numbers	1 day
3	Scheduling engine updated to use new capacity	1 day
4	Testing with real task sheet import	1 day

Total: approximately 4 development days after approval.
